

Dear Mr(s). President,

Many countries have created laws to specifically address different types of cloning and if it should or shouldn't be allowed. The US is not one of these countries, which is the reason this letter has been sent to the White House. If this is anyone else reading, please stop now and give this to the president.

America has been the last colonised, the last founded, the last to fulfill its present day size, but it could be the first on this topic, this could be history in its making!

One way America can be ahead is to allow animal cloning for experimentation so scientists can develop experience in the field of cloning. If scientists clone more animals, the success rate of the cloning will go up and the animal or plant will live longer. According to Google search, "When scientists working at the Roslin Institute in Scotland produced Dolly, the only lamb born from **277 attempts**, it was a major news story around the world." Whilst some people may think that this will be a waste of time and money, the more America's scientists try to clone living things, the better the scientists will be at it!

Another way America can be ahead is to have human cell cloning and transplants. If scientists clone the animals and we bring up the success rate, people's cells can be cloned and replace people's damaged cells. This will allow people to live longer with healthy cells. According to <https://www.genome.gov/25020028#a1-13> "Researchers hope to use embryonic stem cells, which have the unique ability to generate virtually all types of cells in an organism, to grow healthy tissues in the laboratory that can be used replace injured or diseased tissues." Some people may think that this will not succeed, but how will the world know if it will work if it is not tried?

A third way America can be ahead is that America can perfect the art of cloning. If scientists clone more in general, the success rate will go up, the price will go down, and there will be endangered/recently

extinct animals who will live again. According to <https://www.genome.gov/25020028#a1-7> "...cloned other sheep that have been genetically modified to produce milk that contains a human protein essential for blood clotting. The hope is that someday this protein can be purified from the milk and given to humans whose blood does not clot properly..." Cloning this type of sheep could be used to help people. Whilst some people may think that this will be a waste of time and money, the more America's scientists try to clone living things, the better they will be!

Please consider this information,
FionAlb

Afterward

This "letter" was written by me to try to convince the president of America to accept cloning on certain terms. It was fun trying to support something like cloning when there isn't a lot of cloning around yet. Finding evidence took time but was pretty much everywhere because there was so little.
